
105 Series: Unidirectional operation assured by ball and slot "no-back" system. Motors listed are all clockwise rotation when facing the output shaft. **Characteristics:** Rotor Speed 600 rpm,115V AC, 60 Hz Coil, 2.7 watts, -20°C to +55°C Operating Temperature. Heat rise +54°C nominal. Motor develops 300 oz. in. Torque starting & running at 1 RPM. Motors shown utilize standard gearing rated for 30 oz. in. max. load. To determine torque available on motors shown, divide 300 oz. in. by listed motor speed.

800I Series DC Gearmotor: Basic 2400 and 4800 armature speed used. Geartrain rating 30 oz. in. dynamic, 90 oz. in. static. Starting and running torque 60oz-in.@ 1rpm. These ratings are conventionally stated for output geared to 1rpm. The torque theoretically available at another output speed is the torque at 1rpm divided by the desired speed. Input power 2 watts. Motor output speed will be higher if load is less than 30 oz. in. Voltages offered 12VDC and 24VDC. DC motors are reversible by reversing polarity at terminals. Operating these motors at voltages greater than 10% of nominal, could possibly cause premature motor failure.

P.C. Board Mount: .100" (2.54mm) center. These three circuit transistor sockets are preassembled and ready for soldering to a P.C. Board. The proven double cantilever design eliminates circuit failure due to thermal expansion and/or mechanical tolerances. Linear movement of the transistor leads in the socket does not affect contact reliability.

Heat Sinks

Aavid's Ultrastick is a unique phase-change thermal interface material that surpasses grease in thermal performance and long-term stability. This solid, silicone free, paraffin based thermal compound changes phase at 60°C, with a concurrent volumetric expansion that fills gaps between the mating surfaces. One cost effective application leaves a thin, film like deposit, providing excellent heat transfer and low interface thermal resistance.

Features:

- Thermal resistance 20% lower than thermal grease, with significant long-term reliability benefits
- Excellent heat transfer properties, consistent at mounting pressures from less than 5 psi to more than 200 psi
- No run-out, migration, dry-out, or flaking that can occur with typical thermal grease
- Non-toxic and inert
- Electrically nonconducive
- Easy to use and dry to the touch after application, reducing labor costs
- Each bar covers approximately 1,000 in^2

A CTS COMPANY

Heat Sinks

International Electronic Research Corporation has helped pioneer the development of semiconductor heat sinks since 1954. Primarily used by all levels of OEM's engaged in the manufacture of commercial and military equipment, IERC maintains stock and support from prototype through production. IERC has prided themselves for their flexible manufacturing, quality products and on-time delivery.

Clip-On versions have a built-in clip for attaching device to heat sink without additional hardware, positive locks prevent the semiconductor from sliding out. TO-220 versions will also fit TO-202, TO-218 and TO-126 pkgs.

Wattage values listed are at still air conduction only. Moving air will increase this value.

THE BERGQUIST COMPANY

Heat Sink Pads “The Alternative To Grease”

Sil-Pad 600® is a thermally conductive, silicone elastomer filled with special ingredients to provide higher thermal properties than the original fiberglass based Sil-Pad This material has excellent physical and mechanical characteristics while remaining cost competitive. (Electrically Insulating Material)

Sil-Pad 900-S® family of thermally conductive insulation materials are designed for low cost applications requiring high thermal performance. Intended as an improved Sil Pad 600 alternative.

Q-Pad 3® is a thermally conductive, fiberglass reinforced graphite imbedded elastomer which conforms to surface textures extremely well. This material eliminates problems associated with thermal grease such as contamination of electronic assemblies and reflow solder baths. Q-Pad 3 may be installed prior to soldering and cleaning. (Electrically Conducting Material)

Sil-Pad K10® is a thermally conductive Kapton composite film coated with boron nitride filled polyester resin. Offering the highest thermal properties of the Kapton insulators with minimum thickness and lower thermal resistance. Designed to replace brittle ceramic insulators. (Electrically Insulating Material)

NEW! **Sil-Pad KA-10™** is the highest performance insulator that utilizes Bergquist's dielectric material T- Film™

CPU Pad® is a thermally conductive, electrically insulating, Kapton double coated tape. Typically used between the CPU and heat sink, it was designed to be used in place of clips used to attach heat sink to CPU. No clamping times or high pressure is required.

SPT 400 is a thermally conductive insulation for clip mounted plastic power devices. These TO-220 thermal tubes slip over the semiconductor device and conduct the heat to the heat sink and clip. Designed to be used on heat sinks with metal clips to attach device to heat sink. (Electrically Insulating Material)

HI-FLOW™ 115-AC is a thermally conductive fiber reinforced phase change material. The product consists of a thermally conductive 65° C phase change compound coated on a fiberglass web, with an adhesive coating on one side for attachment to a cold heat sink. Handles like a Sil-Pad, at room temperature and flows like high quality grease at elevated temperature.

Bond Ply™ 100 is a thermally conductive, double-sided pressure sensitive adhesive tape. The tape consists of a high performance, thermally conductive acrylic adhesive coated with a fiberglass reinforced interweave. Bond Ply 100 is designed to attain high bond strength to a variety of surfaces, and to maintain high bond strength with long term exposure to moderate heat and high humidity. Typical Applications: • Mounting a heat sink to a BGA graphic processor • Mounting a heat sink to a computer processor • Mounting a heat sink to a drive processor • Mounting a heat spreader to a power converter PCB • Mounting a heat spreader to a motor control PCB.

Gap Pad™ 1500 is designed to cost-effectively maximize heat transfer from electronic components to heat sinks or heat spreaders. GP 1500 is a highly comformable low-modulus material that fills air gaps due to steps, rough surfaces, and high stack-up tolerances. The softness relieves stress and absorbs shocks minimizing damage to delicate leads. GP 1500 is an electrically isolating material that allows its use in applications requiring isolation between heat sinks and high voltage, bare leaded devices.

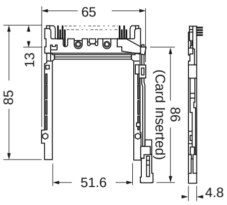
IC1 Series — Figure 1:

The IC1 Series connectors comply with Ver. 3 and Ver. 4.2, JEIDA and PCMCIA 2.0 Standards.

Features: • Provided with complete features of the JEIDA and PCMCIA Standards, such as polarizing method and sequence construction for circuit protection. • Surface-mount socket connectors (card side). • Off-center socket connectors are also available that allow high packaging profile. • All the pin connectors described are compatible with cards of type I and II. • Surface mount header connectors are available.



IC7 Series — Figure 2:

The IC7 Series of miniature, lightweight 68-pin connectors complies with JEIDA Ver. 4.2 and is suitable for use with PCMCIA Type III cards.

Features: • Smaller and thinner than our previous product. • Forty-seven percent lighter than our previous product. • Equipped with an eject button for smooth removal of cards. • Two types of eject button, either left or right. • There is also a reverse type for mounting on the back surface of the board. • Equipped with a frame ground terminal. • Types available for dip and SMT board mounting methods. • The SMT type can be mounted on both sides of the board and can also be used as a 2-slot connector.

Thyristors – SiBOD™

Crydom Thyristor Suppression Devices (SiBOD™ Avalanche Devices) offer the highest quality and performance for protection of sensitive telecommunications circuitry. They "crow-bar" potentially dangerous transients – switching them to ground and dissipating the voltage to zero. This approach handles more energy than TVS diode "clamping".

ZXSC100 Single Cell DC-DC Converter Solution

The ZXSC100 series is designed for DC-DC applications where step-up voltage conversion from very low input voltages is required. These applications mainly operate from single nickel cadmium or nickel metal hydride battery cells. The ZXSC100 devices are non-synchronous PFM, DC-DC controller ICs which drive an external transistor. Zetex SuperSOT4™ switching transistors, with saturation resistance as low as 13mΩ are recommended as the external switching element. These bipolar transistors are the best switching devices available for this type of DC-DC conversion, enabling high efficiency conversion with input voltages down to below 1 volt.

ZXCT1009 High-Side Current Monitor

The ZXCT1009 is a high-side current sense monitor. Using this device eliminates the need to disrupt the ground plane when sensing a load current. It takes a high-side voltage developed across a current shunt resistor and translates it into a proportional output current.

Trench MOSFETs

A new Trench structure is used for this latest family of N-channel MOSFETs. The 20, 30, 60 and 100 volt platforms have been optimized to provide a very low on-resistance coupled with a low gate charge requirement. With the emphasis on small surface mount packages, ranging in size from the small SOT-23 to the larger SO-8, the resulting family of devices can be used in a wide range of power management and load management applications. (P-Channel devices are in development.)

Super E-Line

The standard lead formation is collector-base-emitter (c-b-e) “in-line.” The Zetex Super E-Line range brings together advanced chip technology and assembly techniques to give superior performance in a TO-92 style package. Parallel studies into chip design and assembly techniques have been combined to produce the outstanding features of the Super E-Line.

High Current Gain:

A major objective of the chip design was to produce a range of transistors with improved gain properties at high current levels. By utilizing advanced power efficient geometries and diffusion techniques, *minimum gains of 75 have been achieved at collector currents of 2 amps on standard hFE range product, while “Super-ß” types can show a minimum gain of 400 at 3A (without a heat sink!)*

High Performance Complementary Pairs:

Selective chip design has produced excellent gain linearity and extremely low base resistance, ideal for consumer applications including audio amplifiers and complementary drivers.

High Current Handling Capability:

Improvements in equalizing current distribution across the chip (avoiding ‘hot spots’) has produced a continuous current (IC) rating of 5 amps and peak pulse currents (ICM) of 20 amps. This makes the ZTX850 and ZTX950 series ideal for applications such as solenoids, actuators, relays, lamp drivers, motor drivers and photo flash units. The ZETEX SUPER E-LINE gives performance and reliability beyond standard TO-92 products and metal-can transistors. The package is approved over and beyond the full military temperature range. Zetex E-Line transistors are currently in use in many military applications and have been approved for 20 years application use in telecommunication equipment.

Low Saturation Voltage

Advanced chip geometry design and optimized processing lead to minimized Rce(sat). For example the ZTX849 demonstrates an equivalent on-resistance of 36mΩ at 5A. This allows cost effective replacement of much large packaged devices in switching applications.

Environmental Protection:

The silicone plastic used for the Zetex E-Line encapsulation protects the active semiconductor chip from exposure to corrosive agents, moisture and extreme environmental conditions. The absence of ionic contamination in the silicone allows chip operation up to 200°C without risk of failure. In regular tests conducted by the Quality Assurance Dept., E-Line devices are operated at Tamb = 230°C under reverse bias conditions. All devices must survive without degradation. This presents the wide operating and storage temperature range normally associated only with metal-can devices.

Operating and Storage Temperature Range: -55°C to +200°C.

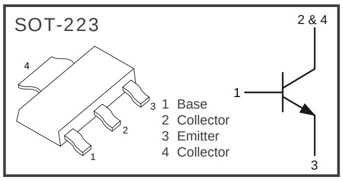
SOT-223



General Information: As surface mount continues to increase its penetration throughout the world of electronics, the SOT-223 is one of many surface mount packages which are the driving force behind this phenomenal growth. The package is capable of housing semiconductor crystals up to 2.5mm x 2.5mm offering power capabilities up to and above 2W (subject to mounting). Designed in a similar fashion to the very popular SOT-23 package, it ensures that it is fully compatible with all industry standard wave and reflow soldering techniques.

Maximum Thermal Ratings: Junction Temperature: 150°C. Operating and Storage Temperature: -55°C to +150°C.

IGBT Transistors

The field of 3-phase 220V PWM motor drives has had mainly bipolars and power MOSFETs competing with one another. Power MOSFETs have been the choice of power electronic designers, especially at power levels below 5 hp because of the ease of drive and their rugged properties. Since FETs are voltage-controlled devices, they require only very small gate current pulses to turn them off and on. The average currents necessary for controlling the device state are often magnitudes lower than those required by bipolar devices of similar ratings. What's more, the FET's wide switching safe operating area (SOA), avalanche and dv/dt capabilities allow for snubberless operation, often a great advantage over bipolars. The $R_{DS(on)}$ of the FET does, however, rise exponentially with voltage rating. The IGBT combines the best of both worlds. It is a voltage-controlled device (like the MOSFET) allowing designers to greatly simplify their drive circuits. It is a rugged device with a square switching SOA and high peak current capability. In addition, it exhibits low forward voltage characteristics similar to bipolars, reducing the conduction loss. For those IGBT's without an internal reverse diode, designers can choose an external fast recovery diode to suit a specific application. (HexFred; see section below for description.) All this indicates that the IGBT will be the device of choice for applications requiring high current densities at high voltages coupled with switching frequencies up to 20 to 50 kHz.

High Efficiency WARP™ Speed IGBTs: Optimized for 75-150kHz hard switching frequency. For use in UPS, welding, switch mode power supplies and PFC stages.

HEXFRED technology sets a new standard for high performance ultrafast diodes. This performance advantage can be utilized by the designer resulting in higher efficiency circuits and lower overall system cost. HEXFREDS will: • Allow IGBTS and MOSFETS to run cooler by 10°C, 20°C • Improve overall system efficiency by 1%, 2% • Reduce noise and the need for snubber circuitry • Allow for higher frequency operation • Allow many marginal circuits to work more reliably.

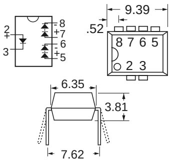
Photovoltaic Isolators

The PhotoVoltaic Isolator (PVI) generates an electrically isolated DC voltage upon receipt of a DC input signal. The PVI is ideally suited for driving power MOSFETs, IGBTs or sensitive gate SCRs to form solid state relays.

PVI1050 — Input Circuit: • Vf (led): 1.2 • Imin (mA): 10 • Imax (mA): 50. **Output Circuit:** • Vout (dc): 5/10 • Imin (µA): 10/5 • Ton/Toff Max (µs): 40/400



PVI5050 — Input Circuit: • Vf (led): 1.2 • Imin (mA): 10 • Imax (mA): 50. **Output Circuit:** • Vout (dc): 5 • Imin (µA): 5 • Ton/Toff Max (µs): 40/4000

PVI5080 — Input Circuit: • Vf (led): 1.25 • Imin (mA): 2 • Imax (mA): 50. **Output Circuit:** • Vout (dc): 5 • Imin (µA): 8 • Ton/Toff Max (µs): 30/400

Sensitive Gate (0.8-10 Amps) and Non-Sensitive Gate (1-70 Amps) SCRs

9291B-ND	Teccor Thyristor Product Catalog	$3.00
9292B-ND	Teccor Sidactor Data Book	$2.25

Sensitive Gate Type: The Digi-Key line of sensitive SCR semiconductors are half-wave unidirectional gate-controlled rectifiers (SCR-thyristor) which complement Digi-Key's line of power SCRs. This group of packages offers current ratings from 0.8-10 amps and voltage ratings from 30-600 volts.

Non-Sensitive Gate Type: The Teccor Electronics line of thyristor SCR semiconductors are half-wave unidirectional gate-controlled rectifiers which complement Digi-Key's line of sensitive gate SCRs. Digi-Key offers devices with current ratings from 1-70 amps and voltage ratings from 100-600 volts with gate sensitivities from 10-50 milliamps.

Electrically Isolated Packages: This group of Teccor sensitive SCRs is available in a choice of 3 different product packages. The TO-220AB and TO-92 are electrically isolated where the case or tab is internally isolated to allow the use of low cost assembly and convenient packaging techniques. **Glass Passivation:** Teccor's line of SCRs features glass passivated junctions to insure long term device reliability and parameter stability. Teccor's glass offers a rugged, reliable barrier against junction contamination. **Features:** • Electrically isolated packages • High voltage capability up to 600 volts • High surge capability up to 100 amps • Glass chip passivation

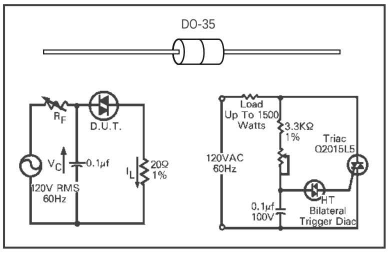
Bilateral Trigger Diacs HT-Series

9291B-ND	**Teccor Thyristor Product Catalog**	**$3.00**
9292B-ND	**Teccor Sidactor Data Book**................	**$2.25**



General Description:

The diac semiconductor is a full-wave or bi-directional thyristor. It is triggered from a blocking-to-conduction state for either polarity of applied voltage whenever the amplitude of applied voltage exceeds the breakover voltage rating of the diac.

The Teccor line of diacs features glass passivated junctions to insure long term device reliability and parameter stability. Teccor's glass offers a rugged, reliable barrier against junction contamination.

Specifications:

- Maximum Ratings, Absolute-Maximum Values. Maximum Trigger Firing Capacitance - 0.1µF; Device dissipation (at^{T}A = -40° to +40°C) -250mW; Derate Above +40°C -3.6mW/°C
- Temperature Ranges: Storage -40° to +125°C; Operating (Junction) -40° to +125°C * Thermal Resistance: Junction to Ambient (^{R}()JA) = 278°C/W; Junction to Lead (^{R}()JL) = 100°C/W. Based on Maximum lead temperature of 85°C @ = 250mW.

Alternistor Triacs 8 to 40 Amps

9292B-ND	**Teccor Sidactor Data Book**	**$2.25**
9291B-ND	**Teccor Thyristor Product Catalog**	**$3.00**

General Description:

Teccor's Alternistor Triac has been specifically designed for applications which are required to switch highly inductive loads. To accomplish this, a special chip has been designed which effectively offers the same performance as two thyristors (SCRs) wired inverse parallel (back-to-back), hence, the alternistor has better turn-off behavior than a standard triac.

All Alternistors have glass passivated junctions to ensure long term reliability and parameter stability.

General Description: SIDACtors® are non-degenerative crowbar/foldback devices that protect telecom circuits from hazardous transient voltages. Connected across tip and ring, the SIDACtor offers the fastest and most reliable overvoltage protection on the market today. In the standby mode, the SIDACtor is transparent to the circuit, due to its high off-state resistance. This equates to a very low leakage current (IDRM), which is especially important during FCC Part 68 testing. Upon application of a voltage exceeding the breakover voltage (VBO), the SIDACtor will switch from its high off-state resistance to essentially a short, protecting your sensitive components from "fast" rising dv/dt's. The SIDACtor will continue to simulate this short until the current flowing through the device is either interrupted or drops below the SIDACtor's minimum holding current (IH), at which time the SIDACtor resets itself.

With the SIDACtor, the design engineer is guaranteed the most cost effective and reliable solution to FCC Part 68, UL 1459, and Bellcore 1089. Because the SIDACtor is a solid state solution, it offers the only technology that can be above the 268V ringing requirement of FCC Part 68 and still protect a 350V rated component. And because the SIDACtor has such a low on-state resistance, the SIDACtor can operate continuously at one full amp and withstand both FCC's 200A 10x160 µs surge without any additional series resistance.

General Description: The Sidac is a silicon bilateral voltage triggered switch with greater power-handling capabilities than standard diacs. Upon application of a voltage exceeding the Sidac breakover voltage point, the Sidac switches on through a negative resistance region to a low on-state voltage. Conduction will continue until the current is interrupted or drops below the minimum holding current of the device.

Applications: • High voltage lamp ignitors • Natural gas ignitors • Gas oil ignitors • High voltage power supplies • Xenon ignitors • Over voltage protector • Pulse generators • Fluorescent lighting ignitors • HID lighting ignitors

Features: • AC circuit oriented • Glass passivated junctions • High surge current capability

General Notes: • All measurements are made at 60Hz with a resistive load at an ambient temperature of +25°C unless otherwise specified. • Storage temperature range (TS) is -65°C to +150°C. • Junction temperature range (TJ) is -40°C to +110°C. • Lead solder temperature is a maximum of +230°C for 10 seconds maximum; ≥ 1/16" (1.59mm) from case.

NEW! CARDINAL COMPONENTS, INC.

FIPO™ Field Instantly Programmable Oscillators

The FIPO system from Cardinal is indispensable for such things as prototypes, early stage design, unexpected design problems, modification, immediate service, a sudden ramp in production and volume production. Cardinal Oscillator Blanks are "Twice Programmable" to correct errors or to reuse the same part for two separate applications with different frequency and/or different output characteristics without having to dispose of the original part. Oscillator Blanks are available in four different package styles: Full Size 14 Pin Dip, Half Size 8 Pin Dip, 5x7 Ceramic SMD, and a Plastic SMD package. Frequency ranges are available from 1MHz to 133MHz in 5V, and 1MHz to 100MHz in 3.3V, and in ±100ppm, 50ppm and ±25ppm frequency stability options.

Tri-State Mode – The output of the part is weakly pulled low when the control pin goes low. The active circuitry continues to operate, allowing a rapid return to normal operation when the control pin goes high.

Power Down Mode – When the control pin goes low, all active circuitry on the chip within the oscillator is shut down. For reactivation, time in which the part regains its output is minimal.

CTS Reeves MXO45 Clock Oscillators

Tri-State Output

Tri-State Logic uses the two standard logic levels of high (logic 1) and low (logic 0) but has added a third state that is not a logic level but an open circuit condition that effectively disconnects the output from your circuit with a high impedance (floating) state. Thereby enabling the use of numerous oscillators on the same bus line. Also, by using the enable pin to control the output, the crystal is still running even when the output is disabled (stand-by mode), thus eliminating any start-up time for the oscillator.

CTS HCMOS/TTL products utilize an Application Specific Integrated Circuit (ASIC) design strategy. Employing a single design family supporting both HCMOS/TTL applications helps in reducing costs and lead times. Utilizing ASIC technology reduces the number of components inside the XO (crystal oscillator), thus increasing reliability and further reducing cost.

For the Enable/Disable Function in the ECS-8FM, ECS-3953C, ECS-3953M, ECS-3951C, and ECS-3951M Series, an internal pullup resistor from Pin 1 to Pin 4 allows active output if Pin 1 is left open. A 0.01µF bypass capacitor should be placed between V_{DD} (Pin 4) and GND (Pin 2) to minimize power supply line noise.

Series resonance appears resistive in the circuit and impedance at fs is at its minimum value. Unless load capacitance is specified, all crystals are manufactured at series resonance. When a crystal is operating at parallel resonance (fL) it will look inductive in a circuit. Crystal frequency varies depending on the value of load capacitance. The load capacitance is the dynamic capacitance of the total circuit as measured or computed across the crystal terminals. Always specify the load capacitance if the crystal will be operated in the parallel mode.

Parabolic Temperature Curve

To determine frequency stability, use parabolic curvature. For example: What is the stability at 45°C?
(1) Change in T (°C) = 45 - 25 = 20°C
(2) Change in frequency
= 0.04 PPM x $(\Delta T)^2$
= 0.04 PPM x $(20)^2$
= -16.0 PPM

TOKO

Ceramic Resonators

TOKO ceramic resonators utilize the piezoelectric principle converting a mechanical force (stress) into an electrical signal or converting an electrical signal into a mechanical force. The ceramic resonator is a thin section of piezoelectric ceramic material, such as quartz, whose sides are metallized into a corresponding pair of electrodes and upon the application of current produce a lengthwise vibration.

Panasonic Surface Mount Inductors

These are wire wound type chip inductors that can accommodate automatic and high-density mounting in electronic circuits.

Features:

- Very thin wires are wound on a high magnetic effect drum core, resulting in high Q and excellent frequency characteristics.
- High reliability because the coil is molded by heat-resistant epoxy resin.
- Flow and reflow soldering is possible due to adoption of metal terminals.

High Frequency Chip Inductors

The HFI series is designed for high frequency application up to 6GHz due to its low inductance. The total of three compact sizes are available (1.6 x 0.8 x 0.8mm, 2.0 x 1.2 x 0.9 mm, and 1.0 x 0.5 x 0.5 mm) according to inductance requirement (from 1.2nH to 100nH at 100 MHz). For high frequency application including cellular phones, pagers, PDAs, computer communications, etc.,

Surface Mount Dual Toroid Inductors

The PM3602 and PM3604 Series are versatile surface mount coils that can provide different functions in a single package. A bifilar method is used in the winding of these coils. The user can utilize these coils in four different ways, depending on the external connection chosen:

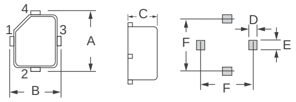
(1) Parallel Connection:	Doubles the current capacity
(2) Series Connection:	4 times the parallel inductance
(3) Dual Inductor:	Creates two differential mode inductors
(4) 1:1 Ratio Transformer:	For isolation and some flyback applications

Features:
• Toroidal core design to minimize RFI radiation • Low loss core material • Encapsulated in case for pick and place capability • Reflow soldering • Hi-pot 500V • Operating ambient temperature: -40°C to +85°C

Typical Applications:
• Switching power supplies • Converters • Data communications • Processor/controller circuits • Personal computers • Filters

Series Mode

Parallel Mode



Series or parallel connections are made at the circuit level (not an internal connection of the device.

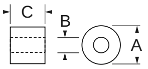
Ferrite Beads



The addition of a Ferrite Bead to a piece of wire causes the impedance of the lead to increase and acts like a small RF choke at high frequencies. It is possible to dissipate high frequency parasitic signals and attenuate undesirable frequencies that travel on DC circuits by the use of beads.

Ribbon Cable Solids: Rectangular shaped solid ferrites for ribbon cable, flat cable and flex cable. Note: Ribbon cable must be slid through the solid ferrite before ends are connected.

Vinyl Dipped Ribbon Cable Solid: Rectangular shaped solid ferrite for ribbon cable, flat cable and flex cable. The ferrite is vinyl dipped to protect it from chipping and keep it from damaging other components.

Ribbon Cable Clip-On with Plastic Mounting Kit: Split ferrites for ribbon cable press fit into the plastic clamp ends protecting the ferrite and providing for secure retention. The plastic mounting clamps are designed to be attached with rivets, screws, nylon or other hardware.

Ribbon Cable Clip-On with Metal Clips: Split ferrites for ribbon cable clamp together with metal clips providing for secure retention of the two halves of ferrite.

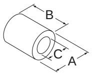
Tubular Bead



A solid ferrite EMI tubular bead for use in high volume applications where a plastic snap on a case is not required. Can be used in high volume over-mold applications where it is desired to have the filter molded in the same material as the connector backshell; or can be covered with heat shrink and shrunk in place.

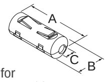
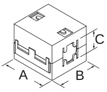
Clamp-On Ferrites





Commonly called “bisected” or “split” components, clip on parts are generally associated with after market retrofit applications or for use in gaining compliance during the testing of a product. These parts provide excellent common mode EMI suppression in round cable applications and for use with network cables.

Cylinder Snap: A tube ferrite snap-on assembly designed for wires or small diameter cable.
Box Snap: A box shaped clip on ferrite assembly.

Power Entry Modules

C Series: The C series is a two-function power entry module combining a DPST switch and an IEC 320 power line connector. **EC Series:** This series of filtered power entry modules provides the highest attenuation of any standard filter available in a package size limited by the dimensions of the integral IEC connector. These filters combine high common-mode inductance with high differential-mode capacitance and minimal parasitic elements, for effective attenuation of line-to-ground and line-to-line noise across the frequency range. **ED Series:** These filtered power entry modules are more effective than general purpose filters in applications where line-to-line and low frequency line-to-ground noise must be controlled. **EEA Series:** A new design in both the internal structure and manufacturing process makes this series cost effective and compact. **EF Series:** This rugged international series of filtered power entry modules incorporates the special IEC power line connector. They are UL recognized, CSA certified, and VDE and SEV approved. Models with F suffix are SEMKO approved and comply with BSI standards. **GG Series:** The GG series power entry modules combine the functions of a general purpose RFI filter with IEC power cord connector and single or dual metric fusing, in the smallest possible panel space. **H Series:** The H series was developed specifically for health care applications. These products are suitable for uses in both patient care equipment and nonpatient care equipment. Their extremely low leakage current allows compliance with UL544 and CSA 22.2 health care specifications. **J Series:** The most widely accepted of all the power entry modules, the J series combines an IEC connector, 2 voltage, or 4 voltage selection, and a North American fuseholder. **P Series:** This series of power entry modules offers full flexibility of design in the most compact package. As the first 10 Amp module to provide all five power entry functions in one compact design, the "Chameleon" readily adapts to its environment and the needs of international markets. • Snap-in or flange mounting • IEC power line connector • Both North American and European fusing capabilities • Two voltage selection • Optional DPST on/off switch • Filtering options for general purpose and medical applications. **LA Series:** A multi-function power entry connector with a choice of filtering capabilities. The series features an IEC line connector, selectable North American or dual European fusing capabilities, DPST on/off switch, and 120/240 voltage selection. The filtered LA units provide a one piece solution to all power entry needs and provide a filtering solution for almost any RFI problem. Their vertical design is flange mounted and will meet requirements for worldwide markets. **M Series:** This series of power entry modules offers the most choices of power entry components and filtering options to fit a specific need. **SR Series:** The SR series includes a full line of popular AC receptacles. These male and female power line connectors include snap-in and flange mounted models. All have complete safety agency approvals for worldwide usage.

RF Line Filters

B Series: These general purpose common-mode RFI power line filters effectively provide RFI control of line-to-ground noise in a small size at a low cost. **EP Series:** The EP/VP series of RFI filters has been developed to reduce conducted noise to acceptable limits for equipment that must comply with requirements of CISPAR in Europe and the FCC specifications in the USA. **H Series:** The H series filters were developed specifically for health care applications. These products are suitable for uses in both patient care equipment and nonpatient care equipment. Extremely low leakage current allows compliance with UL544 and CSA 22.2 health care specifications. **HT Series:** This series of power line filters provides superior common-mode and premium differential-mode attenuation to RFI noise on the frequency range from 10KHz to 30MHz, for IEC601 and UL544 patient-connected equipment, as well as all other electronic equipment that cannot tolerate any leakage current. **K Series:** These power line filters are general purpose common-mode and differential-mode filters. They are effective in the control of line-to-line as well as line-to-ground RFI interference. They are particularly suited in applications where pulsed, continuous and/or intermittent RFI interference is present. **MV Series:** This series answers the need for a medical filter to help equipment comply with increasing noise sources in medical applications while still meeting leakage current requirements of UL2601. **Q Series:** A series of RFI power line filters that has been developed specifically for switching power supplies and is designed to be all the line filtering needed to control conducted emissions all the way down to 10KHz. **R Series:** These dual T section RFI power line filters provide premium performance at a moderate cost. They are well suited for impedance loads where noisy RFI environments are present. They control pulsed, continuous and/or intermittent interference, insuring protection of your equipment from power noise in addition to protecting the line from equipment noise. **S Series:** The S series of RFI power line filters combines successful line-to-ground interference rejection filters with additional circuitry designed to reduce line-to-line noise and transients. **SK Series:** This series of RFI power line filters was designed to reduce conducted noise to acceptable limits for equipment that must comply with the FCC specifications in the USA and CISPAR specifications in Europe. **T Series:** These RFI power line filters provide superior common-mode and premium differential-mode attenuation, exceeded only by that of Q series filters. **U Series:** The U series was designed to meet the RFI needs created by power factor corrected power supplies. This high performance filter offers a high impedance circuit to mismatch the power supply's impedance characteristics. **V and W Series:** These RFI power line filters will protect equipment from malfunctions due to conducted interference coming into the equipment from the line, especially line-to-line noise and transients. The W series has a two-stage construction that provides excellent suppression at high frequency. **EDP Series:** These RFI power line filters provide enhanced differential-mode performance for applications requiring more line-to-line protection. **EOP Series:** A general purpose filter which is effective in removing both common and differential-mode noise for susceptibility applications. **X Series:** This series was designed to bring most digital equipment (including switching power supplies) into compliance with FCC Part 15J, Class B conducted emission limits. **Z Series:** A design that brings most digital equipment (including switching power supplies) into compliance with EN55022 Level B, (as well as FCC Part 15J, Class B) conducted emission limits. **N Series:** The N series RFI filters are designed to provide superior common-mode attenuation for most digital electronic equipment (particularly switching power supplies) over the frequency range of 10KHz to 30MHz.

NEW! Power Line EMI Filters

The EB series are general purpose EMI filters, which suppress high frequency conducted noise both into and out of the equipment through the power lines. The compact and low cost designs make these a good choice for cleaning up noisy power lines.

The EK series are general purpose EMI filters with enhanced differential mode performance. They are effective in suppressing both common mode and differential mode noise. This series is a very good choice when it is required to comply with basic EMI emission regulations, such as FCC-A and VDE-A.

The ER series are high performance EMI filters with multi-stage design for both common mode and differential mode noise suppression. This series is most useful when attenuation is required for compliance with stringent EMI emission regulations such as FCC-B and VDE-B.

The HB series are general purpose EMI filters specially designed for medical and dental equipment, both patient care and nonpatient categories. The leakage current in this series is extremely low to satisfy the stringent leakage current limit imposed by safety regulations for medical and dental equipment, such as UL544 and IEC601.

SPECIFICATIONS:

• **Operating Temperature:** -40°C to +85°C • **Rated Working Voltage:** 6.3 to 50VDC • **Rated Capacitance:** 0.1 to 2200µF • **Capacitance Tolerance:** ±20% • **Leakage Current:** I = 0.002CV + 1 (mA) max.; Where, I: DC leakage current (µA) C: rated capacitance (µF), V: DC rated working voltage (V). Leakage current is measured after 2-minute application of the rated DC working voltage. • **Surge Voltage:** The listed surge voltage is applied to the capacitor in series with 1,000 ohms resistor at a cycle of 0.5 minute “ON” and 4.5 minute “OFF” repeating 1,000 times at 25°C ±10°C. After the test, the capacitor should meet the following limits:

Working Voltage	Surge Voltage
10 V DC	13 V DC
16	20
25	32
50	63

Capacitance change	Within ±10% of the initial measured value

• **Load Life:** After 2,000 hour application of DC working voltage at +85°C with specified RMS ripple current, the measurements should meet the following requirements:

Capacitance change	Within ±20% of the initial measured value
tan ∂	Less than 200% of the initial specified value
DC leakage current	Less than the initial specified value

Surge Voltage & Surge Voltage Test: The DC surge voltage is the maximum voltage to which the capacitor should be subjected. The surge voltage listed below is applied in series with a 1,000 ohm resistor at a cycle of 0.5 minutes "ON" and 4.5 minutes "OFF", repeated 1,000 times at 25°C.

Rated DC Voltage:	16	25	35	50	63	100	200	250	400	450
Surge Voltage:	20	32	44	63	79	125	250	300	450	500

After the test, the capacitor shall meet the following limits: Capacitance change of ±20% of initial measured value; DC leakage current less than initial limits; and D.F. less than 150% of initial limits.

Ripple Voltage: The sum of the DC voltage plus the AC peak ripple voltage shall not exceed the rated DC voltage and there shall be no application of reversed voltage.

Ripple Current (mA):

Frequency (Hz):	50Hz	60Hz	120Hz	500Hz	1KHz	10 ~ 50KHz
16V ~ 100V:	0.93	0.95	1.0	1.05	1.06	1.15
160V ~ 450V:	0.75	0.8	1.0	1.2	1.25	1.4

D.C. Leakage Current: Measurements shall be made at rated working voltage at 20°C. The voltage shall be applied to the capacitor for a minimum period of 5 minutes before reading the leakage current. Maximum leakage current shall not exceed the value given by the following formula: 16 ~ 100V: in case of C X V = 100,000µFV I = 0.01CVµA max. in case of C X V = 100,000µFV I = 3 v C x VµA max. 160 ~ 450V: 1 = 3 v C x VµA max. where I = leakage current in mA, C = rated capacitance in µF V = DC rated WV in volts.

Load Life Test: The capacitor shall be subjected to application of the DC rated voltage with full rated ripple current in the specified ambient temperature for the specified life period. The capacitor shall then be removed from the test chamber and stabilized at room temperature. After reaching temperature stability; the capacitor shall not exceed the following specified values listed: Capacitance change within ±20% of the initial measured value. D.F. 150% of the initial limits. DC leakage current ≤5 initial limits.

Class 2, High Dielectric Constant

Features: • Large capacitance in small size • Minimum coating resin on leads **Applications:** • Coupling and By-pass, where low losses and high stability of capacitance are not so important **Specifications:** • Operating Temperature Range: -25°C to 85°C • Rated Voltage: 25 VDC, 50VDC, 500VDC • Dielectric Withstanding Voltage: 250% of the rated voltage for 1 to 5 seconds (no damage occurs when the test voltage is applied between terminals) • Capacitance: measured at 1kHz ±10%, 1 Vrms and 20°C within the specified tolerance - standard capacitance tolerance [Y5P]: ±10% [Y5V, Z4V]: +80/-20% • Dissipation Factor: [Y5P]: D.F. ≤0.025 [Y5V, Z4V]: D.F. ≤0.05 • Insulation Resistance: C≤0.02 µF: ≥10000 MΩ, C>0.02 µF: CR products ≥ 200 MΩ (measured at the rated voltage and 1 minute electrification) • Temperature Characteristics:

$$\text{Cap. Change} = \frac{\triangle C}{C20} \times 100\%$$

Where C20: Capacitance value in pF at the specified reference temperature of 20°C.
△C: Capacitance drifts in pF from the capacitance value at 20°C over the specified temperature range.

Panasonic Multilayer Ceramic Chip Capacitors 0201, 0402, 0603, 0612, 0805, 1206 & 1210

FEATURES:
- Small in size and wide capacitance range
- Superior humidity characteristic and long life due to the monolithic construction
- Excellent solderability and resistance to soldering heat due to terminals with three layers of silver nickel and solder
- Low self-inductance and excellent frequency characteristic

RECOMMENDED APPLICATIONS:

Class 1 (T.C. Type): Temperature compensations, tuned circuits and filter circuits, where low loss and high stability of capacitance and high insulation resistance are required.

Class 2 (HI-K type): Coupling and By-pass, where low loss and high stability of capacitance are not so important.

Surface Mount MICA Capacitors

Cornell Dubilier mica capacitors are made of pure India Ruby muscovite mica. It is among the most inert and stable materials in the universe. When used as the insulator (dielectric) in a capacitor, the result is an electronic component with the ultimate in stability and reliability.

The capacitance change from zero to full rated operating voltage is generally less than ±0.1%. The series inductance of these capacitors is as little as eight nanohenrys (nH). The stability characteristics also apply to frequency which is why mica capacitors are so useful in the gigahertz range.

Mica capacitors are so efficient that less that 0.05% of the applied volt-amperes is lost as heat. Dipped silver mica capacitors such as the Standard Types are manufactured by applying pure silver to ultra-thin mica plates. The plates are stacked and secured by brass clips with copper-clad steel leads welded to each clip. The extra mass of the metal acts as a heat sink and enables these capacitors to absorb voltage transients up to 100,000 volts per microsecond.

CDE CORNELL DUBILIER GC/Waldom

Dipped Silver MICA Capacitors — Radial Lead

Cornell Dubilier mica capacitors are made of pure India Ruby muscovite mica. It is among the most inert and stable materials in the universe. When used as the insulator (dielectric) in a capacitor, the result is an electronic component with the ultimate in stability and reliability.

The capacitance change from zero to full rated operating voltage is generally less than ±0.1%. The series inductance of these capacitors is as little as eight nanohenrys (nH). The stability characteristics also apply to frequency which is why mica capacitors are so useful in the gigahertz range.

Mica capacitors are so efficient that less that 0.05% of the applied volt-amperes is lost as heat. Dipped silver mica capacitors such as the Standard Types are manufactured by applying pure silver to ultra-thin mica plates. The plates are stacked and secured by brass clips with copper-clad steel leads welded to each clip. The extra mass of the metal acts as a heat sink and enables these capacitors to absorb voltage transients up to 100,000 volts per microsecond.

Card Type Speakers

Ultra-thin and ultra-light, these new card type speakers deliver a wide frequency range of high-quality sound. These amazing new Card Type Speakers from Panasonic are only 1/5th the thickness of dynamic speakers (comparing the WM-R57A with dynamic speakers which have the same dimensions). Based on newly developed, original technology, they deliver top-quality, low-distortion reproduction across a wide frequency sound. So small and light, they are ideal for applications that range from notebook PCs, PDAs, and other mobile communications to AV equipment and home electronics.

Key Features: • Ultra-thin, ultra-light design using a piezo ceramic diaphragm. • Outstanding broad-spectrum audio reproduction made possible by the two-way mechanical structure of the divided diaphragm, combining one large speaker for low-frequency sounds with four small speakers for high-frequency sounds. • Newly developed double construction damper and high polymer material minimize distortion, ensuring superior reproduction. • Because no coil or magnet is used, there is no leakage of electromagnetic radiation to interfere with magnetic media. • The vibrating membrane is covered completely with a high polymer coating, to protect against dampness, dust, and corrosion.

HORN INDUSTRIAL

Electret Condenser Microphone

Electret condenser microphones consist of a high voltage internal electret membrane, a metal electrode, and a field effect transistor (FET). Horn Industrial microphones are manufactured in a quality controlled facility in China. All microphones are produced with Japanese made FETs to ensure high quality and reliability. This along with 100% testing ensure a zero defect rate. Horn's commitment to quality has earned them approval from a famous global manufacturer of mobile phones. Horn's ECMs utilize a highly efficient, low impedance design, available in omni directional, unidirectional, and noise canceling versions. Typical applications are telephone and telephone answering equipment, tape recorders, intercoms, hearing aids, and sonically controlled games and toys. All microphones are non-washable.

Phycomp
A FORMER PHILIPS COMPANY

Surface Mount 1% & 5% Thick Film Chip Resistors

DESCRIPTION:
The resistors are constructed on a high grade ceramic body (aluminum oxide). Internal metal electrodes are added at each end and connected by a resistive paste which is applied to the top surface of the substrate. The composition of the paste is adjusted to give the approximate resistance required and the value is trimmed to within tolerance, by laser cutting of the resistive layer. The resistive layer is covered with a protective coat. Finally, the two external end terminations are added. For ease of soldering the outerlayer of these end terminations is a lead/tin alloy.

PANASONIC® 5% Metal Oxide Film Resistors

Now Available In Tape and Reel

Matsushita fixed metal oxide film resistors feature small sized dimensions and have higher power rating at the same size as the conventional type.

Features:

Flame retardancy of the exclusively formulated inorganic insulative material exhibits an equivalent performance requirements of UL-94 (VE-O) and when operated at a potential less than 16 times RCWV, Matsushita metal (oxide) film resistors never flame nor arc. The coating and markings resist normal washing of solvents, such as Freon (TE, TMC, TF), trichloroethane.
